Cage guiding: The cage allows positive alignment and control of the plug. The outside diameter of the valve plug is close to the inside wall surface of the cylindrical cage throughout the travel range. This ensures correct valve plug/seat ring alignment when the valve closes. The cage guiding can provide a stable control to high drops of pressure. In addition, the guide of the cage reduces the vibration and the mechanical noise.

Control valves 101 | Processing Magazine

A control valve is comprised of an actuator mechanism that is capable of changing the position of flow controlling element in the valve. The valve modulates flow through movement of a valve plug in relation to the port(s) located within the valve body. The valve plug is attached to a valve stem, which, in turn, is connected to the actuator.
