Spina Bifida Genetic And Developmental

Spina bifida is a complex condition that is likely caused by the interaction of multiple genetic and environmental factors. Some of these factors have been identified, but many remain unknown. Changes in dozens of genes in individuals with spina bifida and in those of their mothers may influence the risk of developing this type of neural tube defect.

Spina bifida: MedlinePlus Genetics

Spina bifida is a type of neural tube defect in which the neural tube (the structure in an embryo that becomes the brain and spinal cord) does not completely close during development in the womb. This may result in part of the spinal cord sticking out through an opening in the spine, leading to permanent nerve damage.

Is Spina Bifida Genetic or Hereditary?

Experts know that genes play a role, and they are looking for the exact gene (s) that cause Spina Bifida. In time, research should clearly show how Spina Bifida develops so new treatments or even a cure can be developed. This research may also lead to new tests that help people or couples understand their chance of having a baby with Spina Bifida.

Genetics & Spina Bifida - Spina Bifida Association

Scientists suspect the factors that cause spina bifida are multiple: genetic, nutritional, and environmental factors all play a role. Research studies indicate that insufficient intake of folic acid—a common B vitamin—in the mother’s diet is a key factor in causing spina bifida and other neural tube defects.
