The Emergency Flow Concept Patient

Patient flow is the movement of patients through a healthcare facility. It involves the medical care, physical resources, and internal systems needed to get patients from the point of admission to...

What Is Patient Flow?

The second part of the model, throughput, refers to the ED processes that impact patient flow, including triage, staffing, and the availability of specialty and diagnostic services. Finally, output refers to the ability of the ED to physically move patients out of department, such as moving patients to inpatient units or discharging them home.

Improving Patient Flow and Reducing Emergency Department ...

The term 'flow' describes the progressive movement of people, equipment and information through a sequence of processes. In healthcare, the term generally denotes the flow of patients between staff, departments and organisations along a pathway of care. Flow is not about the

Improving patient flow - Health Foundation

after overnight admissions and before patient discharge starts. Peak flow is when the most patients are being moved in and out of beds. It normally occurs in the late afternoon, as emergency arrivals and elective discharges peak. • Flow needs space: every patient transfer requires sufficient resources for the process to happen without delay.

Understanding patient flow in hospitals - The Nuffield Trust

The term “vertical patient flow” refers to the process of redesigning the front-facing operations of an ED to improve throughput and patient satisfaction. This process requires a high degree of political and collegial support in order to be implemented successfully.

Keeping Patients Vertical in the Emergency Department

...

The Patient Flow Systems Framework was developed through state-wide collaboration that used Redesign Methodology to identify elements that contribute to good patient flow. 7 key elements have been developed to enable a system wide approach to identify and resolve delays within the current system to create capacity.

Patient Flow Systems Framework - NSW Health

Increased infrastructure needs to be in place to absorb the ebbs and flows of patient load, and by utilizing this approach the bottom line of EM budgets can be severely impacted. Ultimately, good vertical patient flow will likely utilize several of the above approaches to decrease wait times and improve access to care.

Best Practices: Vertical Patient Flow and ED Overcrowding ...

The emergency department (ED) often is the face of the hospital and the location where the majority of inpatient admissions occur. When the ED is efficient, it improves performance and drives patient satisfaction for the entire hospital stay. A positive ED experience creates a more positive stay overall and improved patient satisfaction scores.

The concept of value-stream mapping is simple but highly effective: identify the flow of work throughout the ED for various conditions (e.g., stroke). Then evaluate the flow and determine the most effective method (the best practice) for carrying out each step in that process.

Improve Clinical Workflow: The Emergency Department

Smooth communication and cooperation are keys to pull systems for patient transfer. Be a Bed Ahead: Pull Patients from ED to Inpatient Unit. The Be-a-Bed-Ahead system addresses the delay in moving patients from one point of care to the next, for example, from the emergency department (ED) to the inpatient unit.

In the Emergency Department, accurate diagnosis in a minimum of time is critical to ensure the best patient outcomes. Every minute counts: you need to identify patients at high risk of a life-threatening condition and rapidly initiate appropriate treatment. At the same time, cost containment and optimized patient flow management are also essential.
